Abstract *Polydactylus kuru* (Bleeker, 1853), originally described from Jakarta, Java, Indonesia, has been regarded as a valid species. However, examination of two syntypes of *Polynemus kuru* revealed their close similarity to three syntypes of *Polynemus sexfilis* Valenciennes in Cuvier and Valenciennes, 1831, in the synonym of which the former is herein included. *Polydactylus sexfilis*, which is widely distributed in the Indo-Pacific region, is redescribed on the basis of a newly-designated lectotype and two paralectotypes, and a wide range of non-type material. The species is characterized by six pectoral filaments, 15 or 16 pectoral fin rays, 61–67 pored lateral line scales, 8–10 scales above the lateral line, 12–14 below, 11–14 and 15–18 upper and lower series gill rakers, respectively (27–31 total), teeth present on vomer and a long second dorsal fin ray (mean 26% [range 21–30%] of standard length).

Key words Polynemidae · Redescription · *Polydactylus sexfilis* · *Polydactylus kuru* · Synonymy

The threadfin, *Polydactylus sexfilis* (Valenciennes in Cuvier and Valenciennes, 1831), a widely-distributed Indo-Pacific species originally described from Mauritius, has usually been regarded as a valid species (e.g., Sauvage, 1891; Munro, 1955; Jones and Kumaran, 1980). Although *Polydactylus kuru* (Bleeker, 1853), originally described from Jakarta, Java, Indonesia, has also been regarded as a valid species (e.g., Kendall and Goldsborough, 1911; Weber and de Beaufort, 1922; Mishra and Krishnan, 1993), type materials of the two have never been directly compared. Examination of two syntypes of *Polynemus* (=*Polydactylus*) *kuru* showed them to correspond closely with three syntypes of *Polynemus* (=*Polydactylus*) *sexfilis*. Accordingly, *Polydactylus kuru* is herein regarded as a junior synonym of the latter.

Polydactylus sexfilis is redescribed herein on the basis of a wide range of material, including a newly-designated lectotype and two paralectotypes, because the taxonomic characters of the species have been somewhat equivocal to date. In addition, *Polydactylus sexfilis* is compared with the following related Indo-Pacific polynemid

species: *Polydactylus nigripinnis* Munro, *Polydactylus plebeius* (Broussonet) and *Polydactylus sextarius* (Bloch and Schneider).

Methods

Counts and measurements generally follow Hubbs and Lagler (1958) and Feltes (1991), with some modifications following Motomura et al. (2000). Standard length and total length are expressed as SL and TL, respectively. Terminology of the supraneural bones follows Mabee (1988), and the formula for configuration of the supraneural bones, anterior neural spines and anterior dorsal fin pterygiophores, Ahlstrom et al. (1976). The configuration of the supraneural bone and vertebral counts were confirmed from X-ray photos taken of all specimens. Institutional codes follow Leviton et al. (1985), with additional institutional abbreviations as follows: Center for Research and Development of Oceanology, Indonesian Institute of Science, Ambon, Indonesia (CRDOA); Division of Fisheries Sciences, Miyazaki Uni-

Polydactylus sexfilis (Valenciennes in Cuvier and Valenciennes, 1831)
 (English name: golden sixthread tasselfish)
 (Japanese name: Nan'you-agonashi)
 (Fig. 1A, B)

Polydactylus sexfilis Valenciennes in Cuvier and Valenciennes, 1831: 515 (type locality: Mauritius); Günther, 1860: 325 (Mauritius); Sauvage, 1891: 312 (Madagascar); Munro, 1955: 97 (Sri Lanka); Kagwade, 1970: 50 (India); Jones and Kumaran, 1980: 200 (Laccadive Archipelago, India).

Polydactylus kuru Bleeker, 1853: 600 (type locality: Jakarta, Java, Indonesia); Günther, 1860: 325 (Ternate, Halmahera, Indonesia); Weber, 1913: 141 (Amboin, Indonesia); Weber and de Beaufort, 1922: 209 (Amboin, Indonesia).

Trichidion kuru; Bleeker, 1863: 156 (Sidangoli, Halmahera, Indonesia); Bleeker, 1883: 22, pl. 453, fig. 1 (locality not provided, originally *Polynemat* pl. 1, unpublished plate by P. Bleeker).

Polydactylus sexfilis; Fowler, 1935: 282 (Shanghai and Hong Kong, China); Munro, 1967: 192 (New Guinea); Talwar and Jhingran, 1992: 909 (India, name only in Key); Senou, 1995: 847, 1339 (Iriomote Island, Ryukyu Islands, Japan).

Polydactylus kuru; Talwar and Kacker, 1984: 750 (India); Kendall and Goldsborough, 1911: 263 (Nukuhiva, Marquesas Islands); Mishra and Krishnan, 1993: 285 (locality not provided, but probably India).

Polydactylus sextarius (not of Bloch and Schneider); Fricke, 1999: 306 (Mascarene Islands).

Lectotype. MNHN 9731, 265 mm SL, Mauritius, collected by J.-F. Desjardins.

Paralectotypes. MNHN A. 3027, 9728, 2 specimens, 92–96 mm SL, Mauritius, collected by J. R. C. Quoy and J. P. Gaimard.

Other materials (n = 35, 36–217 mm SL). ANSP 77717 (2 specimens), 137–163 mm SL, Honolulu, Oahu Island, Hawaiian

Islands; ANSP 87002 (2), 110–116 mm SL, Laysan Island, Hawaiian Islands; ANSP 89923 (4), 130–154 mm SL, Laysan Island, Hawaiian Islands; ANSP 95564, 168 mm SL, Guam; ANSP 101489, 90 mm SL, Marquesas Islands, Polynesia; ANSP 104561, 196 mm SL, Honolulu, Oahu Island, Hawaiian Islands; ANSP 107349, 54 mm SL, North West Bay, Mahé Island, Seychelles Islands; ANSP 145362 (3), 88–101 mm SL, West Island, Cocos-Keeling Islands, Australia; ANSP 145363, 100 mm SL, West Island, Cocos-Keeling Islands, Australia; BMNH 1874.11.9:12, 210 mm SL, Palau; FRLM 16635, 104 mm SL, Lombok Island, Indonesia; FMNH 91312 (2), 73–76 mm SL, Dunidu Island, Maldives; FSKU-P 21009, 138 mm SL, Okinawa Island, Ryukyu Islands, Japan; MNHN A. 3023, 154 mm SL, Pondicherry, India; MNHN 1967-561, 92 mm SL, Marquesas Islands, Polynesia; NSMT-P 2288, 63 mm SL, Misaki, Kanagawa, Japan; QM I. 12370, 126 mm SL, Dobo, Aru Islands, Indonesia; RMNH 6006 (2 syntypes of *Polynemus kuru* Bleeker), 87–198 mm SL, Jakarta, Java, Indonesia; RMNH 33884 (3), 203–217 mm SL, Jakarta, Java, Indonesia; URM-P 32074, 36 mm SL, Nakagusuku fish market, Okinawa Island, Ryukyu Islands, Japan; URM-P 36431–36433 (3), 62–72 mm SL, Amitori Bay, Iriomote Island, Ryukyu Islands, Japan; ZMH 1001, 101 mm SL, Kaneohe Bay, Oahu Island, Hawaiian Islands.

Diagnosis. A species of *Polydactylus* with the following combination of characters: six pectoral filaments, not reaching to origin of anal fin; 15 or 16 pectoral fin rays; 61–67 pored lateral line scales; 8–10 scales above lateral line, 12–14 below; 11–14 upper series gill rakers, 15–18 lower, 27–31 total; teeth present on vomer; second dorsal fin ray long (mean 26% [range 21–30%] of SL).

Description. Counts and proportional measurements as percentages of SL of the lectotype, paralectotypes and other material of *Polydactylus sexfilis* are given in Table 1. Characters given in the diagnosis are not repeated. Data for the lectotype are presented first, followed by other specimen data (if different) in parentheses.

Body oblong, compressed; maxilla covered with scales; orbit diameter greater than snout length; lower lip well-developed; posterior margin of maxilla reaching level of posterior margin of adipose eyelid; depth of posterior portion of maxilla shorter than dermal eye opening; teeth villiform in broad bands on vomer, palatines and ectopterygoids; all pectoral fin rays unbranched; sixth pectoral filament longest, extending slightly beyond (extending slightly beyond or reaching to) level of posterior tip of upper part of pectoral fin; thickness of base of all first dorsal fin spines similar; second dorsal fin base length equal to (approximately equal to) anal fin base length; distance between pelvic and anal fin origins less than (approximately equal to) head length; lateral line simple, extending from upper end of gill opening to upper end of lower caudal fin lobe; formula for configuration of supraneural bones, anterior neural spines and anterior dorsal pterygiophores 0/0/0+2/1+1/1/1/1/; vertebrae 10 + 14; swimbladder large.

Coloration.—Body in life uniform golden or silvery (Munro, 1955; Jones and Kumaran, 1980). Color of body in alcohol largely uniform golden; upper sides of head gold-tinted, becoming white on lower sides; occasionally 7–9 prominent dark stripes along longitudinal scale rows above lateral line, 1 or 2 faint stripes below (generally stripes not apparent); snout region semitransparent; base and posterior portion of first and second dorsal fins light yellow, tips blackish-brown, otherwise whitish-cream; pelvic fin light yellow posteriorly, otherwise whitish-cream; anal and caudal fins yellow; intensity of pectoral fin pigmentation variable; pectoral filaments whitish-yellow.

Distribution and ecological note. *Polydactylus sexfilis* is widely distributed in the Indo-Pacific region, generally in the vicinity of oceanic islands (Fig. 2). The species is considered to be less dependent upon large freshwater rivers (based on known locality data) than other heavily-dependent polynemid species.

Remarks. According to Bleeker (1853), the syntypes of *Polynemus kuru* included two specimens, 125 and 280 mm TL. Subsequently, Hubrecht (1879) reported a total of five examples of the species (group A, 4 specimens; group B, 1 specimen), which were originally registered as RMNH 6006; 87 mm SL (120 mm TL), 198 mm SL (281 mm TL), 203 mm SL (291 mm TL), 204 mm SL (288 mm TL) and 217 mm SL (311 mm TL). The total lengths (120 mm TL and 281 mm TL) of the two smallest specimens are closest to those given by Bleeker, the specimen being likely to have resulted from shrinkage of the snout region, the 5 mm difference for the smallest being easily damaged in polynemid fishes owing to the high proportion of cartilaginous tissue. Accordingly, we herein identify the two smallest specimens as the original syntypes for *Polynemus kuru*, the remaining three being reregistered (RMNH 33884) as non-type Bleeker specimens.

Valenciennes (*in* Cuvier and Valenciennes, 1831) described *Polynemus sexfilis* on the basis of three specimens (MNHN 9731, 265 mm SL; MNHN A. 3027, 96 mm SL; MNHN 9728, 92 mm SL). We herein designate the largest specimen (MNHN 9731) as the lectotype, the remaining syntypes (MNHN A. 3027 and MNHN 9728) becoming paralectotypes.

The characters of the syntypes of *Polynemus kuru* were found to be consistent with those of the lectotype, paralectotypes and other material of *Polydactylus sexfilis* (Tables 1, 2). Accordingly, *Polydactylus kuru* (Bleeker, 1853) is regarded as a junior synonym of the latter.

Fricke (1999) synonymized *Polydactylus sexfilis* with *Polydactylus sextarius* (Bloch and Schneider, 1801), but his opinion was clearly erroneous (see Comparisons). Although Munro (1955, 1967) and Menon and Babu Rao (1984) described the pectoral fin of *Polydactylus sexfilis*

Table 1. Counts and proportional measurements of *Polydactylus sexfilis*, including types and non-type specimens, expressed as percentages of standard length

	Lectotype of <i>Polynemus</i> <i>sexfilis</i> MNHN 9731	Paralectotypes of <i>Polynemus</i> <i>sexfilis</i> MNHN A. 3027–9728 (n = 2)	Syntypes of <i>Polynemus kuru</i> RMNH 6006 (n = 2)	Non-type specimens of <i>Polydactylus sexfilis</i> (n = 33)

as being black, the fin membrane pigmentation was found to be quite variable (from no pigment to entirely black) in this study.

Comparisons. Like *Polydactylus sexfilis* (Valenciennes in Cuvier and Valenciennes, 1831) and two other Indo-West Pacific *Polydactylus* species, viz.

Polydactylus nigripinnis Munro, 1964 and *Polydactylus sextarius* (Bloch and Schneider, 1801), are characterized by six pectoral filaments. *Polydactylus sexfilis* can be easily distinguished from *Polydactylus sextarius* in lacking a large black spot anteriorly on the lateral line (vs present in the latter), and possessing villiform teeth in broad

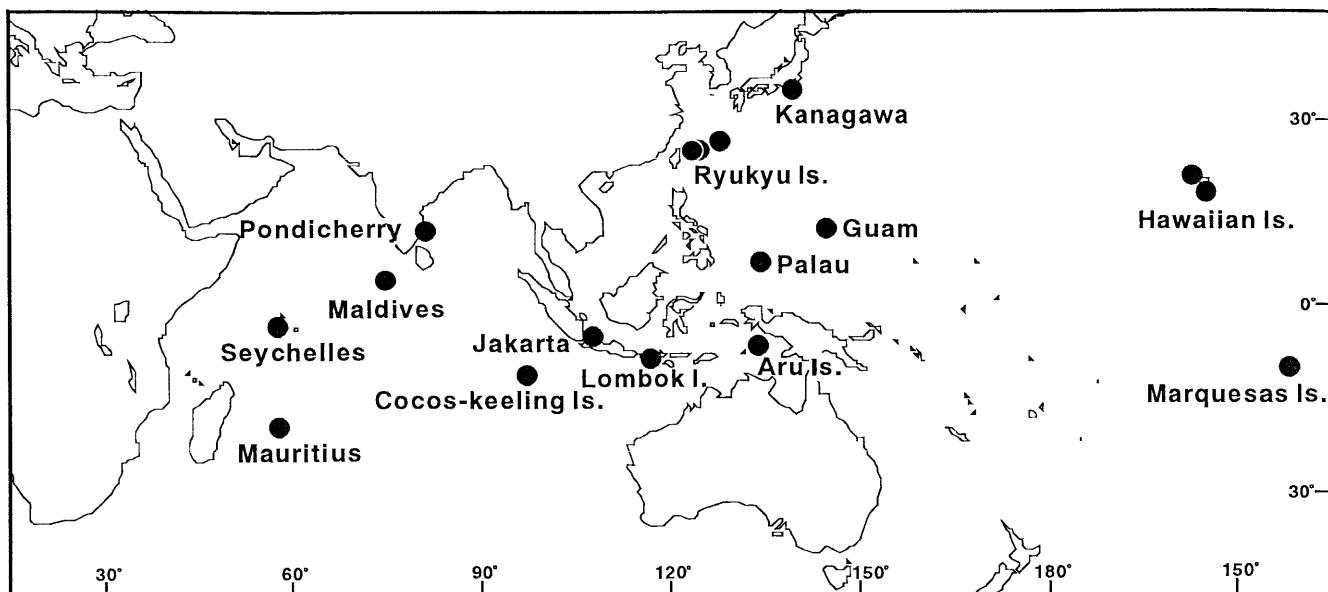

Fig. 2. Localities of specimens of *Polydactylus sexfilis* examined in the present study

L, P, and S indicate lectotype and two paralectotypes of *Polynemus sexfilis*, and two syntypes of *Polynemus kuru*, respectively

bands on the vomer (vs teeth absent) and unbranched pectoral fin rays (vs almost branched). Furthermore, *Polydactylus sexfilis* differs from *Polydactylus nigripinnis* in having villiform teeth in broad bands on the vomer (vs teeth absent in the latter) and a shorter pectoral fin (posterior tip not reaching to posterior tip of pelvic fin vs extending beyond the latter) and higher gill raker counts (mode 30 [range 27–31] vs 27 [23–27]).

Polydactylus sexfilis is most similar to *Polydactylus plebeius* (Broussonet, 1782) in overall body appearance, but differs from the latter in having higher counts of pectoral filaments (6 vs 5 in the latter), lower counts of pectoral fin rays (mode 16 [range 15–16] vs 17 [16–18]) and higher counts of gill rakers (30 [27–31] vs 26 [24–32]) (see Table 2). Furthermore, *Polydactylus sexfilis* tends to have a longer second dorsal fin ray than *Polydactylus plebeius*, although the proportional length measurements for such overlapped between the two species (mean 26% [range 21–30%] of SL vs 22% [19–28%]; Fig.

3). Both anal and caudal fin rays of *Polydactylus sexfilis* are also slightly longer than those of *Polydactylus plebeius* (anal fin: mean 23% [range 20–26%] of SL vs 19% [17–23%]; upper caudal fin: 44% [39–48%] vs 39% [33–44%]; lower caudal fin: 41% [37–46%] vs 36% [30–41%]).

Comparative material examined. *Polydactylus nigripinnis* Munro: CRDOA K. 322, 154 mm SL, Inpres fish market, Kupang, West Timor, Indonesia; CSIRO A. 1827 (1 of 3 paratypes of *Polydactylus nigripinnis*), 94 mm SL, Kerema Bay, Gulf of Papua, Papua New Guinea; CSIRO A. 1828 (holotype of *Polydactylus nigripinnis*), 103 mm SL, Purari River; CSIRO A. 1830 (1 of 3 paratypes of *Polydactylus nigripinnis*), 100 mm SL, Purari River; FRLM 21472, 139 mm SL, Ambon, Indonesia; FRLM 23413, 161 mm SL, Rumahtiga fish market, Poka, Ambon, Indonesia; FRLM 23468–23470 (3 specimens), 143–172 mm SL, Passo fish market, Ambon, Indonesia; URM-P 20814, 149 mm SL, Kerema Bay, Gulf of Papua, New Guinea. *Polydactylus plebeius* (Broussonet): AMS I. 10581, 119 mm SL, Manila, Luzon Island, Philippines; AMS IB. 2329,

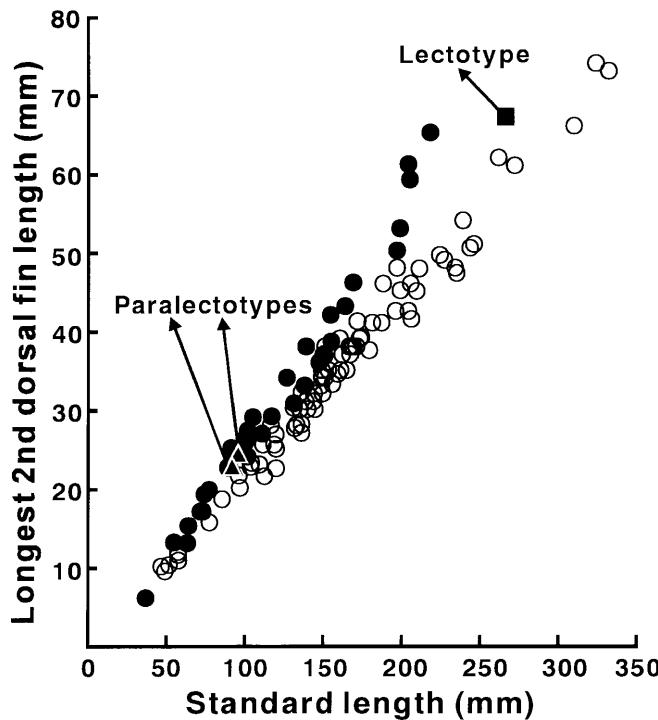

Fig. 3. Relationship between standard length and longest second dorsal fin ray length in *Polydactylus plebeius* (open symbols) and *Polydactylus sexfilis* (closed symbols)

Acknowledgments We are most grateful to G. Duhamel, J.-C. Hureau and P. Pruvost (MNHN), and M.J.P. van Oijen and J. van Egmond (RMNH) for loans of the types of *Polydactylus sexfilis* and *P. kuru*, respectively. We are also grateful to the following persons and institutions for specimen loans: M. McGrouther and K. Parkinson (AMS); W.G. Saul and M. Sabaj (ANSP); J. Maclaine and A.-M. Hine (BMNH); A.Y. Suzumoto (BPBM); Y. Machida and K. Sasaki (BSKU); T. Peristiwady (CRDOA); M.A. Rogers and K. Swagel (FMNH); H. Ida (FSKU-P); K. Matsuura (NSMT); S. Bussarawit and U. Satapoomin (PMBC); J. Johnson (QM); L. Hoenson (SAM); H.-L. Wu (SFU); D.W. Nelson (UMMZ); T. Yoshino (URM); S.L. Jewett, L. Palmer and J.T. Williams (USNM); M. Hayashi (YCM); H.-J. Paepke (ZMB); H. Wilkens (ZMH). Lastly, we

thank Y. Motomura (Miyazaki, Japan) for her assistance and G.S. Hardy (Thames, New Zealand), who read the initial manuscript and offered helpful comments. This study was supported in part by grants awarded to the first author by the Fujiwara Natural History Foundation (Tokyo, Japan), the Sasakawa Scientific Research Grant from the Japan Science Society (Tokyo, Japan), and the Ito Foundation for the Advancement of Ichthyology (Tokyo, Japan), and to the second author by the Ministry of Education, Science, Sports and Culture (10640684) (Tokyo, Japan).
