

MERIDIONAL HYDROGRAPHIC SECTIONS AND PLANKTONIC FORAMINIFERAL ASSEMBLAGES IN THE WEST PACIFIC OCEAN IN 1995

Akio HATTA, Kiyoshi SHIMADA, Masaki UCHIYAMA, Keisuke
YOSHINAGA, Shigeru FUJIEDA, Shigeki TERADA, Shirou SUWA and
Hirotaka FUJISAKI

Introduction

Oceanographical surveys and studies of planktonic foraminiferal assemblages were carried out in Oct. 1995. The water temperature and salinity data were noted and planktonic Foraminifera were collected in the west Pacific on a voyage from Kagoshima to Palau. Oceanographic data were taken with CTD and XBT. Samples of planktonic Foraminifera were collected by vertical towing.

Observation Stations and Sampling Stations

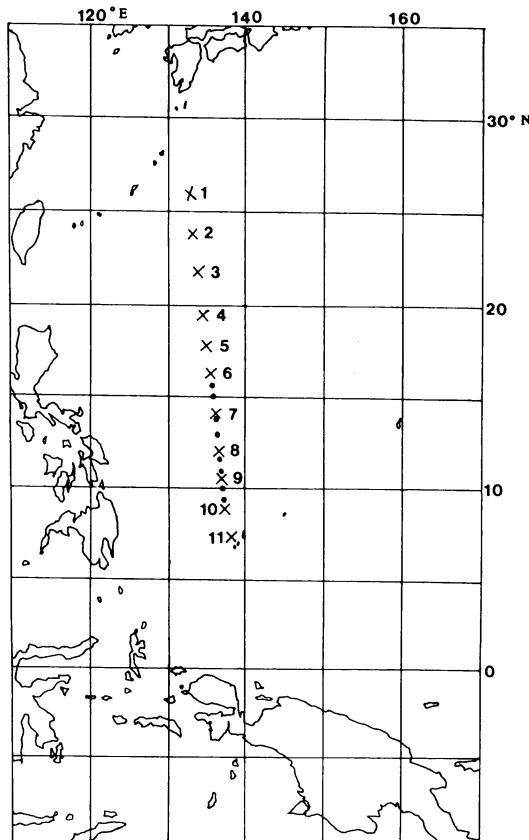

Fig. 1 Sampling stations in the West Pacific Ocean.
Map showing observation stations and sampling stations of planktonic Foraminifera.
Symbols; x: CTD observation and planktonic Foraminifera ; · : XBT observation

Planktonic foraminiferal sampling stations, and CTD and XBT observation stations are shown in figure 1. The XBT was launched at 8 stations from lat. 15°47.6' N, long. 132°55.0' E, to lat. 9°00.0' N, long. 134°00.0' E. The CTD was lowered at 11 stations from lat. 25°59.6' N, long. 131° 26.1' E, to lat. 7°50.8' N, long. 134°15.0' E. Samples of planktonic Foraminifera were taken at the same 11 stations with points of CTD. Table 1 shows the sampling positions, dates, hours, and temperature and salinity of the sea water. Figure 2 indicates the temperature-salinity diagram of sampling stations of planktonic Foraminifera at horizon in depth of 0-200 m. The T-S diagram of stations Nos. 10 and 11 are different from the others. Also the T-S diagram of No. 7 and 8 is divided from others. And No. 9 is different from the others. T-S diagram is divided into 4 types (Nos. 10 and 11, No. 9, Nos. 7 and 8 and others).

We consider that Nos. 10 and 11 correspond to the North Equatorial Current and No. 9 is equal to the North Equatorial Counter Current. No. 7 and 8 is perhaps the intermediate assemblage. No. 1 to 6 indicate the influence of the Kuroshio Counter Current. Figure 3 shows the vertical distribution of sea water temperature in the region between lat. 26° N, long. 131° E and lat. 5° N, long 134° E. The surface mixed layer of 28°C-29°C was about 70 m thick. There is a sharp thermocline of 15° C at 150-300 m of depths between lat. 50° N and lat. 100° N. The structure of thermocline consists of an upslope from the lat. 5° N to a peak of 7°30' N, and a descent from the peak to the North.

Table 1. CTD and XBT observation data ; Station Number, Date, Time of start of sampling, Position and Temperature of each depth. (T.: temperature, S.: salinity, D : depth)

Sampling Methods of Planktonic Foraminiferal Assemblage

At each station, we collected 4 samples by vertical towing from the sea water between 200-150 m, 150-100 m, 100-50 m, and 50-0 m in depth. Table 2 shows data on planktonic Foraminifera. When the towing wire of the plankton net slanted, the towing wire was lengthened to reach a depth of 50 m. Table 3 shows the towing distance in each 50 m horizon. The 4 samples of each station are the vertical sample and also the quantitative samples. We can get to know the volume of planktonic Foraminifera per unit mass.

Table 3. Sampling data of planktonic Foraminifera

No	Date	Time	Lat	Long	50 ~ 0	100 ~ 50	150 ~ 100	200 ~ 150
1	1995/10/10	18:38~20:00	25 59.6 N	131 26.1 E	62m	61m	58m	66m

Planktonic Foraminiferal Assemblage

BÉ (1977) explains synthetically Recent planktonic Foraminifera. HEMLEBEN et al. (1989) refer to the vertical distribution and daily migration. For the purpose of making clear the ecology, distribution and daily vertical migration, we carried out the planktonic Foraminifera. Meridional hydrographic sections and planktonic foraminiferal assemblages in the West Pacific Ocean were carried out by HATTA, A. and S. HAYASAKA (1987), HATTA, A. et al. (1990), HATTA, A. et al. (1992).

44 samples of planktonic Foraminifera have been examined. The list of planktonic Foraminifera from 11 stations is shown in table 2.

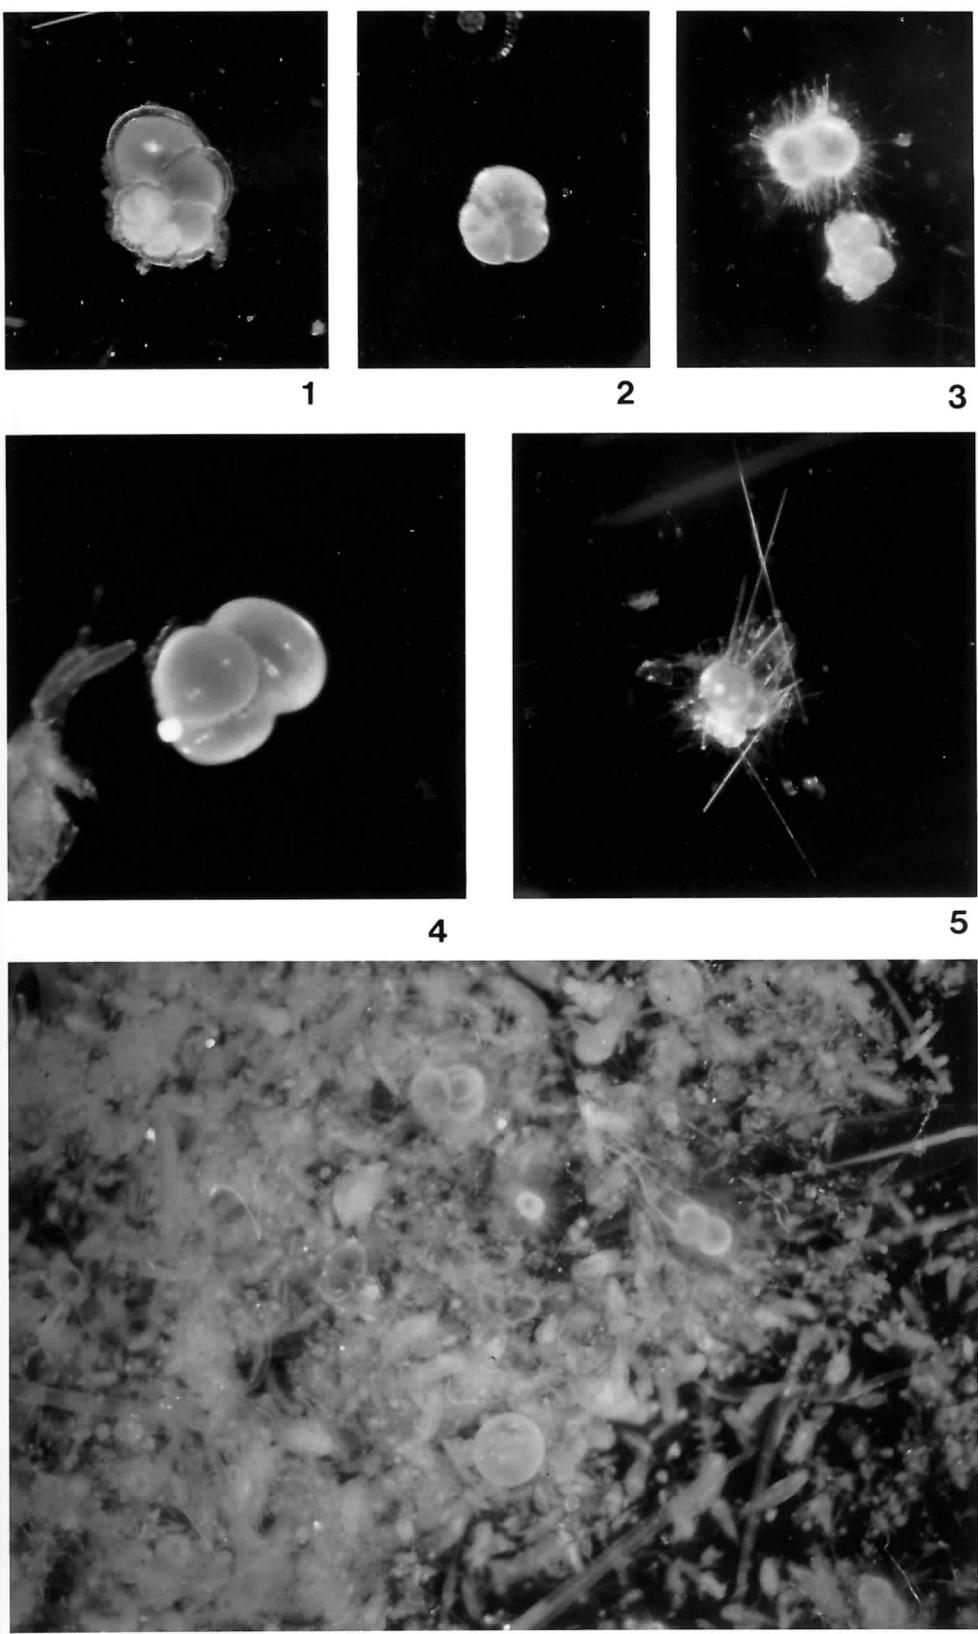

The following species were contained ; *Candeina nitida* D'ORBIGNY, *Globigerina rubescens* HOFKER, *Globigerinella aequilateralis* (BRADY), *G. calida* (PARKER), *Globigerinita glutinata* (EGGER), *Globigerinoides conglobatus* (BRADY), *G. obliquus* BOLLI, *G. ruber* (D'ORBIGNY), *G. sacculifer* (BRADY), *G. tenellus* PARKER, *Globoquadrina conglomerata* (SCHWAGER), *Globorotalia hirsuta* (D'ORBIGNY), *G. menardii* (PARKER, JONES & BRADY), *G. tumida* (BRADY), *Neogloboquadrina dutertrei* (D'ORBIGNY), *Orbulina universa* (D'ORBIGNY), *Pulleniatina obliquiloculata* (PARKER & JONES). The significance of distribution and daily migration of planktonic Foraminifera will be discussed at some other time.
