## A Linearized Model for Vector Control of Induction Motor without Speed Sensor Taking into Account the Effects of Current Control Loop in the Synchronously Rotating Reference Frame

Kazuhiko OYAMA and Katsuji SHINOHARA

The characteristics of a current control loop have great implications for stability of vector control of induction motor without speed sensor. The current control loop is composed in the synchronously rotating reference frame or in the three phase stationary reference frame.

In this paper, we derived the linearized model for vector control of induction motor without speed sensor taking into account the effects of current control loop in the synchronously rotating reference frame by using standard small signal analysis techniques. Next, the transfer function between the rotor speed  $\omega_r$  and the rotor speed command  $\omega_r^*$  are computed to study the influences of the current control loop on the stability.

## 1. まえがき

筆者らは先にトルク成分電流と二次磁束の演算値をフィードバックする速度センサレスベクトル制御系において、三相静止軸上で PI 制御を行っている電流制御ループを考慮した安定性解析を報告した<sup>(1)</sup>。その中で電流制御器の比例ゲインを小さくしていくと速度センサレスベクトル制御系の方が速度センサ付きベクトル制御系よりも早く不安定になることを示した。両者の違いの原因として、電流制御誤差が一次電流を用いたトルク成分電流と二次磁束の演算に影響を与えることが考えられる。従って、定常状態において必ず一次電流指令と実際の一次電流が一致する  $dq$  同期軸上の電流制御ループを用いることにより安定性が改善されることが予想される。

本稿では、先に検討した三相静止軸での電流制御ループを用いた速度センサレスベクトル制御系と比較を行うために、 $dq$  同期軸上で構成された電流制御ル

ープを用いた速度センサレスベクトル制御系を記述する非線形連立微分方程式とその線形化微分方程式を導出した。また、数式の共通部分を同じ記号で置き換えると三相静止軸上で電流制御ループを用いた場合においても線形化微分方程式が簡単化されたので付録2において合わせて報告する。

### 2. 1 解析モデル

図1に  $dq$  同期軸上電流制御ループを用いた速度センサレスベクトル制御系を示す。 $dq$  同期軸上電流制御ループでは検出してきた一次電流を三相- $dq$  変換することにより得られる磁束成分電流  $i_{1d}$  とトルク成分電流  $i_{1q}$  をそれぞれ指令値  $i_{1d}^*$  と  $i_{1q}^*$  に対して PI 制御を行う構成である。その他の構成は、先に報告した三相静止軸上電流制御ループを用いた場合<sup>(1)</sup>と共通である。

## 2.2 連立微分方程式の導出

2.1で述べた通り電流制御ループの構成以外は文献[1]と同じであるので、ここでは  $dq$  同期軸上での電流制御ループの式の導出のみを行い、その他の式の導出は文献[1]に譲る。

図1の破線で囲まれている  $dq$  同期軸上電流制御ループの PI 制御部は次式で表せる。

$$v_{sd} = K_i \left( 1 + \frac{1}{\tau_i p} \right) (i_{1d}^* - i_{1d}) \quad (1)$$

$$v_{sq} = K_i \left( 1 + \frac{1}{\tau_i p} \right) (i_{1q}^* - i_{1q}) \quad (2)$$

(1) (2)式の両辺に  $p$  をかけ整理すると次式が得られる。

$$pv_{sd} = K_i (pi_{1d}^* - pi_{1d}) + \frac{K_i}{\tau_i} (i_{1d}^* - i_{1d}) \quad (3)$$

## 2. 3 線形化微分方程式の導出

### 2. 3. 1 線形化の準備

$\omega_\phi$  の式において動作点近傍の微小変動を考えると,

$$\omega_{\phi 0} + \Delta \omega_\phi = \widehat{\omega}_{r0} + \Delta \widehat{\omega}_r + \frac{M^* R_2^*}{L_2^* \phi_{2d}^*} (i_{1q0}^* + \Delta i_{1q}^*)$$

となる。 $g_1 = \frac{M^* R_2^*}{L_2^* \phi_{2d}^*}$  の置き換えをし、微小変動分と定常項を取り出すと次式が得られる。

$$\Delta \omega_\phi = \Delta \widehat{\omega}_r + g_1 \Delta i_{1q}^* \quad (22)$$

$$\omega_{\phi 0} = \widehat{\omega}_{r0} + g_1 i_{1q0}^* \quad (23)$$

二次磁束と電流の関係式は定常値を用い次式で表わせる。

$$\begin{cases} \phi_{2d0} = M i_{1d0} + L_2 i_{2d0} \\ \phi_{2q0} = M i_{1q0} + L_2 i_{2q0} \end{cases} \quad (24)$$

### 2. 3. 2 誘導機の式(5)～(8)の線形化

(5)式に(17)～(19)式を代入し整理する。

$$\begin{aligned} p i_{1d} &= -\frac{R_1}{l} i_{1d} + \left( \omega_\phi + \frac{PM^2}{2L_2 l} \omega_r \right) i_{1q} + \frac{R_2 M}{L_2 l} i_{2d} \\ &\quad + \frac{PM}{2l} \omega_r i_{2q} + \frac{K_v}{l} v_{sd} \end{aligned}$$

動作点近傍での微小変動を与える。

$$\begin{aligned} (p i_{1d})_0 + p \Delta i_{1d} &= -\frac{R_1}{l} (i_{1d0} + \Delta i_{1d}) + \left\{ (\omega_{\phi 0} + \Delta \omega_\phi) \right. \\ &\quad \left. + \frac{PM^2}{2L_2 l} (\omega_{r0} + \Delta \omega_r) \right\} (i_{1q0} + \Delta i_{1q}) \\ &\quad + \frac{R_2 M}{L_2 l} (i_{2d0} + \Delta i_{2d}) + \frac{PM}{2l} (\omega_{r0} + \Delta \omega_r) \\ &\quad \times (i_{2q0} + \Delta i_{2q}) + \frac{K_v}{l} (v_{sd0} + \Delta v_{sd}) \end{aligned}$$

微小変化分だけを取り出すと,

$$\begin{aligned} p \Delta i_{1d} &= -\frac{R_1}{l} \Delta i_{1d} + \omega_{\phi 0} \Delta i_{1q} + i_{1q0} \Delta \omega_\phi + \frac{PM^2}{2L_2 l} \omega_{r0} \Delta i_{1q} \\ &\quad + \frac{PM^2}{2L_2 l} i_{1q0} \Delta \omega_r + \frac{R_2 M}{L_2 l} \Delta i_{2d} + \frac{PM}{2l} (\omega_{r0} \Delta i_{2q} \\ &\quad + i_{2q0} \Delta \omega_r) + \frac{K_v}{l} \Delta v_{sd} \end{aligned}$$

となる。上式に(22)式を代入し(24)式の置き換えを行い整理すると次式が得られる。

$$\begin{aligned} p \Delta i_{1d} &= -\frac{R_1}{l} \Delta i_{1d} + \left( \omega_{\phi 0} + \frac{PM^2}{2L_2 l} \omega_{r0} \right) \Delta i_{1q} + \frac{R_2 M}{L_2 l} \Delta i_{2d} \\ &\quad + \frac{PM}{2l} \omega_{r0} \Delta i_{2q} + \frac{PM \phi_{2q0}}{2L_2 l} \Delta \omega_r + i_{1q0} \Delta \widehat{\omega}_r \\ &\quad + g_1 i_{1q0} \Delta i_{1q}^* + \frac{K_v}{l} \Delta v_{sd} \quad (25) \end{aligned}$$

以下(5)式の場合と同じ手順を踏み(6)～(8)式の微小変化分を計算すると次のようになる。(6)式より,

$$\begin{aligned} p \Delta i_{1q} &= -\left( \omega_{\phi 0} + \frac{PM^2}{2L_2 l} \omega_{r0} \right) \Delta i_{1d} - \frac{R_1}{l} \Delta i_{1q} - \frac{PM}{2l} \omega_{r0} \Delta i_{2d} \\ &\quad + \frac{R_2 M}{L_2 l} \Delta i_{2q} - \frac{PM \phi_{2d0}}{2L_2 l} \Delta \omega_r - i_{1d0} \Delta \widehat{\omega}_r - g_1 i_{1d0} \Delta i_{1q}^* \\ &\quad + \frac{K_v}{l} \Delta v_{sq} \quad (26) \end{aligned}$$

(7)式より,

$$\begin{aligned} p \Delta i_{2d} &= \frac{R_1 M}{L_2 l} \Delta i_{1d} - \frac{PL_1 M}{2L_2 l} \omega_{r0} \Delta i_{1q} - \frac{R_2 L_1}{L_2 l} \Delta i_{2d} \\ &\quad + \left( \omega_{\phi 0} - \frac{PL_1}{2l} \omega_{r0} \right) \Delta i_{2q} - \frac{PL_1 \phi_{2q0}}{2L_2 l} \Delta \omega_r + i_{2q0} \Delta \widehat{\omega}_r \\ &\quad + g_1 i_{2q0} \Delta i_{1q}^* - \frac{MK_v}{L_2 l} \Delta v_{sd} \quad (27) \end{aligned}$$

(8)式より,

$$\begin{aligned} p \Delta i_{2q} &= \frac{PL_1 M}{2L_2 l} \omega_{r0} \Delta i_{1d} + \frac{R_1 M}{L_2 l} \Delta i_{1q} - \left( \omega_{\phi 0} - \frac{PL_1}{2l} \omega_{r0} \right) \Delta i_{2d} \\ &\quad - \frac{R_2 L_1}{L_2 l} \Delta i_{1q} + \frac{PL_1 \phi_{2d0}}{2L_2 l} \Delta \omega_r - i_{2d0} \Delta \widehat{\omega}_r \\ &\quad - g_1 i_{2d0} \Delta i_{1q}^* - \frac{MK_v}{L_2 l} \Delta v_{sq} \quad (28) \end{aligned}$$

が得られる。

### 2. 3. 3 機械系の式(9)の線形化

(9)式において動作点近傍での微小変動を考えると,

$$\begin{aligned} (p \omega_r)_0 + p \Delta \omega_r &= \frac{1}{J} \left[ \left( \frac{P}{2} \right) M \{ (i_{1q0} + \Delta i_{1q}) (i_{2d0} + \Delta i_{2d}) \right. \\ &\quad \left. - (i_{1d0} + \Delta i_{1d}) (i_{2q0} + \Delta i_{2q}) \} - T_L \right] \end{aligned}$$

となる。微小変化分を取り出すと次式になる。

$$\begin{aligned} p \Delta \omega_r &= -\frac{PM}{2J} i_{2q0} \Delta i_{1d} + \frac{PM}{2J} i_{2d0} \Delta i_{1q} + \frac{PM}{2J} i_{1q0} \Delta i_{2d} \\ &\quad - \frac{PM}{2J} i_{1d0} \Delta i_{2q} \quad (29) \end{aligned}$$

### 2. 3. 4 $\widehat{\phi}_{2d}$ , $\widehat{i}_{1q}$ 演算回路の式(10)(11)の線形化

(10)式において(19)式を代入し動作点近傍での微小変動を考えると,

$$\begin{aligned} (p \phi_{2d}^c)_0 + p \Delta \phi_{2d}^c &= \frac{1}{T_c^*} \left[ \phi_{2d0}^* + T_c^* \frac{L_2^*}{M^*} (K_v (v_{sd0} + \Delta v_{sd}) \right. \\ &\quad \left. - R_1^* (i_{1d0} + \Delta i_{1d}) - i^* \{ (p i_{1d})_0 \right. \right. \\ &\quad \left. \left. + p \Delta i_{1d} \} + (\omega_{\phi 0} + \Delta \omega_\phi) I^* (i_{1q0} + \Delta i_{1q}) \right. \right. \\ &\quad \left. \left. + T_c^* (\omega_{\phi 0} + \Delta \omega_\phi) (\phi_{2q0}^c + \Delta \phi_{2q}^c) \right. \right. \\ &\quad \left. \left. - (\phi_{2d0}^c + \Delta \phi_{2d}^c) \right] \right] \end{aligned}$$

となる。微小変化分だけを取り出すと次式になる。

$$\begin{aligned} p\Delta\phi_{2d}^c = & \frac{1}{T_c^*} \left[ T_c^* \frac{L_2^*}{M^*} \{ K_v \Delta v_{sd} - R_1^* \Delta i_{1d} - l^* p \Delta i_{1d} \right. \\ & + l^* \omega_{\phi_0} \Delta i_{1q} + l^* i_{1q0} \Delta \omega_\phi \} + T_c^* \omega_{\phi_0} \Delta \phi_{2q}^c \\ & \left. + T_c^* \phi_{2q0}^c \Delta \omega_\phi - \Delta \phi_{2d}^c \right] \end{aligned}$$

上式に(22), (25)式を代入して整理すると次式が得られる。

$$\begin{aligned}
& p\Delta\phi_{2d}^c = \frac{L_2^*}{M^*} \left( \frac{l^*}{l} R_1 - R_1^* \right) \Delta i_{1d} - \frac{L_2^*}{M^*} \frac{l^* PM^2}{2L_2 l} \omega_{r0} \Delta i_{1q} \\
& - \frac{L_2^*}{M^*} \frac{l^* R_2 M}{L_2 l} \Delta i_{2d} - \frac{L_2^*}{M^*} \frac{l^* PM}{2l} \omega_{r0} \Delta i_{2q} \\

(11)式においても(10)式と同じ手順を踏み微小変化分を計算すると次式が得られる。

$$\begin{aligned}
p\Delta\phi_{2q}^c = & \frac{L_2^*}{M^*} \frac{l^* PM^2}{2L_2 l} \omega_{r0} \Delta i_{1d} + \frac{L_2^*}{M^*} \left( \frac{l^*}{l} R_1 - R_1^* \right) \Delta i_{1q} \\

### 2. 3. 5 トルク制御器の式(12)の線形化

まず(12)式の中に含まれる  $\hat{i}_{1q}$  と  $\hat{p}i_{1q}$  の線形化を行う。(21)式において動作点近傍での微小変動を考える。

$$\begin{aligned} \widehat{i_{1q0}} + \widehat{\Delta i_{1q}} &= \{ (\phi_{2d0}^c + \Delta\phi_{2d}^c) (i_{1q0} + \Delta i_{1q}) \\ &\quad - (\phi_{2q0}^c + \Delta\phi_{2q}^c) (i_{1d0} + \Delta i_{1d}) \} \\ &\quad \times \{ (\phi_{2d0}^c + \Delta\phi_{2d}^c)^2 + (\phi_{2q0}^c + \Delta\phi_{2q}^c)^2 \}^{-\frac{1}{2}} \end{aligned}$$

微小変化分の積を零とすると次のような。

$$\begin{aligned} \widehat{i_{1q0}} + \widehat{\Delta i_{1q}} &= (\phi_{2d0}^c i_{1q0} + \phi_{2d0}^c \Delta i_{1q} + i_{1q0} \Delta \phi_{2d}^c - \phi_{2q0}^c i_{1d0} \\ &\quad - \phi_{2q0}^c \Delta i_{1d} - i_{1d0} \Delta \phi_{2q}^c) \\ &\quad \times (\phi_{2d0}^{c2} + \phi_{2q0}^{c2} + 2\phi_{2d0}^c \Delta \phi_{2d}^c + 2\phi_{2q0}^c \Delta \phi_{2q}^c)^{-\frac{1}{2}} \end{aligned}$$

上式の  $(\ )^{-\frac{1}{2}}$  項において  $(1 + \Delta x)^n \approx 1 + n\Delta x$  の近似を行うと次のようになる。

$$\widehat{i_{1q0}} + \widehat{\Delta i_{1q}} = (\phi_{2d0}^c i_{1q0} - \phi_{2q0}^c i_{1d0} - \phi_{2q0}^c \Delta i_{1d} + \phi_{2d0}^c \Delta i_{1q} \\ + i_{1q0} \Delta \phi_{2d}^c - i_{1d0} \Delta \phi_{2q}^c) \times (\phi_{2d0}^{c2} + \phi_{2q0}^{c2})^{-\frac{1}{2}}$$

上式を展開し微小変化分だけを取り出すと次式になる。

$$\begin{aligned} \widehat{\Delta i_{1q}} = & -(\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{1}{2}} \phi_{2q0}^c \Delta i_{1d} + (\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{1}{2}} \\ & \times \phi_{2d0}^c \Delta i_{1q} + \{(\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{1}{2}} i_{1q0} - (\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{3}{2}} \\ & \times (\phi_{2d0}^c i_{1q0} - \phi_{2q0}^c i_{1d0}) \phi_{2d0}^c\} \Delta \phi_{2d}^c \\ & + \{-(\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{1}{2}} i_{1d0} - (\phi_{2d0}^{c^2} + \phi_{2q0}^{c^2})^{-\frac{3}{2}} \\ & \times (\phi_{2d0}^c i_{1q0} - \phi_{2q0}^c i_{1d0}) \phi_{2q0}^c\} \Delta \phi_{2q}^c \end{aligned}$$

ここで、 $|\phi_{20}^c| = (\phi_{2d0}^{c2} + \phi_{2q0}^c)^{\frac{1}{2}}$ 、 $g_{02} = \phi_{2q0}^c i_{1d0} - \phi_{2d0}^c i_{1q0}$ とおくと次式が得られる。

$$\begin{aligned}\Delta \hat{i}_{1q} = & -\frac{1}{|\phi_{20}^c|} \phi_{2q0}^c \Delta i_{1d} + \frac{1}{|\phi_{20}^c|} \phi_{2d0}^c \Delta i_{1q} \\ & + \left\{ \frac{1}{|\phi_{20}^c|} i_{1q0} + \frac{1}{|\phi_{20}^c|^3} g_{02} \phi_{2d0}^c \right\} \Delta \phi_{2d}^c \\ & + \left\{ -\frac{1}{|\phi_{20}^c|} i_{1d0} + \frac{1}{|\phi_{20}^c|^3} g_{02} \phi_{2q0}^c \right\} \Delta \phi_{2q}^c \dots \quad (32)\end{aligned}$$

(21)式を時間微分すると次式が得られる。

$$\begin{aligned} \hat{p_{1q}} &= (i_{1q} p \phi_{2d}^c + \phi_{2d}^c p i_{1q} - i_{1d} p \phi_{2q}^c - \phi_{2q}^c p i_{1d}) \\ &\quad \times (\phi_{2d}^{c2} + \phi_{2q}^{c2})^{-\frac{1}{2}} - (\phi_{2d}^c i_{1q} - \phi_{2q}^c i_{1d}) \\ &\quad \times (\phi_{2d}^c p \phi_{2d}^c + \phi_{2q}^c p \phi_{2q}^c) (\phi_{2d}^{c2} + \phi_{2q}^{c2})^{-\frac{3}{2}} \end{aligned}$$

上式において動作点近傍の微小変動を与えると次のようになる。

$$\begin{aligned}
& \widehat{(p\hat{i}_{1q})_0} + p\Delta\hat{i}_{1q} \\

## 2. 三相静止軸上電流制御ループを用いた速度センサレスベクトル制御系の線形化モデル

三相静止軸上電流制御ループの式は次式で表される<sup>(1)</sup>。

付図1 三相静止軸上電流制御ループ

$$pB_d = (K_{hi}/\tau_{hi}) \{ \omega_\phi (i_{1a}^* - i_{1a}) + p\omega_\phi C_a \} + \omega_\phi^2 A_d \dots \quad (付3)$$

$$\dot{p}B_a = - (K_{\phi i}/\tau_{\phi i}) \{ \omega_\phi (i_{1d}^* - i_{1d}) - p \omega_\phi C_d \} + \omega_\phi^2 A_a$$

..... (付4)

$$pC_q = (i_{1q}^* - i_{1q}) + \omega_\phi C_d \dots$$

$$v_{1d} = K_v \{ K_{pi} (i_{1d}^* - i_{1d}) - A_d \}$$

$v_{1q} = K_v \{K_{p_i}(i_{1q}^* - i_{1q}) - A_q\}$

従って、三相静止軸上電流制御ループを用いた速度センサレスベクトル制御系は(5)～(11)，(付1)～(付6)式で記述される。それぞれの式を  $dq$  同期軸上電流制御ループを用いた場合と同様に線形化すると(49)式と同じ形で表わすことができる。ただし状態変数  $\Delta x$  は次のようになる。

$$\Delta x = \{ \Delta i_{11}, \Delta i_{12}, \Delta i_{21}, \Delta i_{22}, \Delta \omega_r, \Delta \phi_{21}^c, \Delta \phi_{22}^c, \Delta \widehat{\omega}_r \}$$

$$Ai^*, Ai^*, AA^*, AA^*, AB^*, AB^*, AC^*, AC^*)^\top$$

また、電動機の速度を出力すると(50)式で表わすことができる。ただし、 $C$ は次のようになる。

$$C = \{0, 0, 0, 0, 1, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0, 0\}$$

従って、速度の伝達関数は(51)式で表わすことができる。 $\mathbf{A}$ ,  $\mathbf{B}$ は付録1の置き換えを用いると次のようになる。
